OASIcs: Instructions for Authors and the oasics-v2021 Class

Schloss Dagstuhl – Leibniz-Zentrum für Informatik Oktavie-Allee, 66687 Wadern, Germany

- Abstract

This document provides general instructions for authors on how to prepare articles to be submitted to the *OpenAccess Series in Informatics* series and a description of the typesetting process. All OASIcs articles are written in LATEX using the LATEX style class of the series. Starting in 2021, the newest version of this style (oasics-v2021) is used for publications. This document presents the functionalities of this style class, along with the instructions for the authors.

2012 ACM Subject Classification General and reference \rightarrow Computing standards, RFCs and guidelines

Keywords and phrases \LaTeX , type setting, style, changelog, oasics-v2021

Supplementary Material The style files including a sample document can be found here: Software (Style): https://submission.dagstuhl.de/styles/download/oasics/authors Software (Source Code): https://github.com/dagstuhl-publishing/styles/archived at swh:1:dir:1b66fc29b44e371e68a77879c0fbebefe3cd34f8

1 Typesetting instructions – Summary

OASIcs – OpenAccess Series in Informatics is a series of open access high-quality conference proceedings across all fields in informatics established in cooperation with Schloss Dagstuhl. In order to do justice to the high scientific quality of the conferences that publish their proceedings in the OASIcs series, which is ensured by the thorough review process of the respective events, we believe that OASIcs proceedings must have an attractive and consistent layout matching the standard of the series. Moreover, the quality of the metadata, the typesetting and the layout must also meet the requirements of other external parties such as indexing services, our DOI service provider, and funding agencies, among others. The guidelines contained in this document¹ serve as the baseline for authors, editors, and the publisher to create documents that meet as many of these requirements as possible.

Please comply with the following instructions when preparing your article.

Minimum Requirements

- Use pdflatex and an up-to-date LATEX system².
- Use further LATEX packages and custom made macros carefully and only if required.
- Use the provided sectioning macros: \section, \subsection, \subsubsection, \paragraph, \paragraph*, and \subparagraph* (for more details, see Section 2.4).
- Provide suitable graphics of at least 300dpi (preferably in PDF format).
- Use BibT_FX and keep the standard style (plainurl) for the bibliography.
- Please try to keep the warnings log as small as possible. Avoid overfull \hboxes and any kind of warnings/errors with the referenced BibT_EX entries.
- Use a spellchecker to correct typos.

² Dagstuhl Publishing is currently using TEX Live 2020, see https://www.tug.org/texlive/.

Since the mentioned requirements are constantly changing, these author guidelines but also the OASIcs style are continuously adapted.

Mandatory Metadata Macros

Please set the values of the metadata macros carefully since the information parsed from these macros will be passed to publication servers, catalogues and search engines. Avoid placing macros inside the metadata macros. For a more detailed explanation and a full list of all metadata macros, see Section 2.3. The following metadata macros/environments are mandatory:

- \title and, in case of long titles, \titlerunning.
- \author, one for each author, even if two or more authors have the same affiliation.
- \authorrunning and \Copyright (concatenated author names)
 The \author macros and the \Copyright macro should contain full author names (especially with regard to the first name), while \authorrunning should contain abbreviated first names.
- \ccsdesc (ACM subject classification³).
- \keywords (a comma-separated list of keywords).
- \relatedversiondetails (if there is a related version like a "Full Version", "Extended Version", or also a predecessor); please make sure to provide a persistent URL, e.g., at arXiv or HAL.
- begin{abstract}...\end{abstract}...

Please do not ...

Generally speaking, please do not override the <code>oasics-v2021-style</code> defaults. To be more specific, a short checklist also used by Dagstuhl Publishing during the final typesetting is given below. In case of <code>non-compliance</code> with these rules Dagstuhl Publishing will remove the corresponding parts of IATEX code and <code>replace</code> it with the <code>oasics-v2021</code> defaults. In serious cases, we may reject the LaTeX-source and expect the corresponding author to revise the relevant parts.

- Do not use a different main font. (For example, the times package is forbidden.)
- Do not alter the spacing of the oasics-v2021.cls style file.
- Do not use enumitem and paralist. (The enumerate package is preloaded, so you can use \begin{enumerate}[(a)] or the like.)
- Do not use "self-made" sectioning commands (e.g., \noindent{\bf My Paragraph}).
- Do not hide large text blocks using comments or \iffalse ... \fi constructions.
- Do not use conditional structures to include/exclude content. Instead, please provide only the content that should be published in one file and nothing else.
- Do not wrap figures and tables with text. In particular, the package wrapfig is not supported.
- Do not change the bibliography style. In particular, do not use author-year citations. (The natbib package is not supported.)

This is only a summary containing the most relevant details. Please read the complete document for all details and don't hesitate to contact Dagstuhl Publishing (publishing @dagstuhl.de) in case of questions or comments.

Upholding the above-mentioned minimum formatting requirements will make the job of authors, volume editors, and Dagstuhl Publishing staff easier and will lead to the timely publication of volumes. There is no reason to tweak anything to save space in the published version of the papers.

2 General Instructions for Authors

On the following pages, the most important instructions for authors are provided to prepare a document to be published in a *OpenAccess Series in Informatics* series volume.

2.1 Preparation

To prepare an article for the OASIcs series, the authors have to provide a \LaTeX^4 document using the oasics-v2021 style. An alternative workflow using another format like Microsoft Word is not supported. Along with \LaTeX^4 BibTEX has to be used to prepare the bibliography (see Section 2.10).

We suggest to employ a recent, up-to-date T_EX installation: the most important distributions are T_EX Live ⁵, MiKTEX/proTEXt and MacTEX. Older versions should (in principle) work as well. However, authors should not use deprecated commands. For instance, $\{mph\{...\}\}$ should be used instead of $\{mm...\}$, see also [1].

Tip: In some cases, the authors might want to have a consistent, uniform formatting of specific words or letters (e.g. variable or parameter names) independent of the formatting of the surrounding text. In this case, it is recommended to define a macro for this variable fixing the formatting, e.g. \newcommand{\X}{\textup{\textbf{X}}}.

2.2 The oasics-v2021 Class

The oasics-v2021 class assists authors in preparing articles for *OpenAccess Series in Informatics* with IAT_EX. It adapts IAT_EX's standard article class to meet some requirements for OASIcs and provides a specific layout.

The package⁶ consists of the following files:

- oasics-v2021-authors-guidelines.pdf (this documentation),
- oasics-v2021-sample-article.tex (the LATEX master file, to be used as a template),
- cc-by.pdf (logo for Creative Commons CC BY),
- oasics-logo-bw.pdf (logo for OASIcs),
- orcid.pdf (logo for ORCID), and
- oasics-v2021.cls (the L^AT_EX class file, providing adaptions of articles.cls for OASIcs and producing the layout).

To use oasics-v2021, put oasics-v2021-sample-article.tex, oasics-v2021.cls, cc-by.pdf, oasics-logo-bw.pdf, and orcid.pdf in your working directory, edit the file oasics-v2021-sample-article.tex in your preferred text editor and run IATEX as usual. (See the following section for more detailed advise.)

oasics-v2021 tries to benefit as far as possible from standard LATEX packages⁷. Therefore, it should also be easy to compile an already written manuscript with the oasics-v2021 layout. To learn more about the underlying packages, we refer to their documentations (try e.g., texdoc [package name] at your shell prompt or visit tug.ctan.org).

\textsf

\textsc

\textit

This documentation is not intended to give an introduction to IATEX. For questions concerning TeX systems/installations or the IATEX mark-up language in general please visit www.tug.org, www.dante.de, uk.tug.org or any other TeX user group worldwide.

⁵ Dagstuhl Publishing is currently using TEX Live 2020, see https://www.tug.org/texlive/.

⁶ Available on https://submission.dagstuhl.de/styles/download/oasics/authors.

⁷ A list of the used packages is provided in section A in the Appendix.

To ensure their long-term preservation, documents with the <code>oasics-v2021</code> style are generated in accordance with the PDF/A-3b standard⁸. A PDF/A file is completely self-contained. It includes everything needed for accurate representation of the contents. For this reason the fonts in all used PDF files (e.g. figures) have to be embedded in them. Furthermore, PDF/A doesn't allow mixing color spaces. The default color space in <code>oasics-v2021</code> is the sRGB color space. So please don't use other color spaces. The PDF/A support is disabled by default to avoid problems with outdated LaTeX installation. To enable the support, add the option <code>pdfa</code> as argument of <code>\documentclass</code>.

pdfa

2.2.1 Paper Format

For OASIcs, the A4 format is the mandatory paper format and will be used to prepare the final version. The option a4paper must be inserted in the optional argument of \documentclass. For intermediate versions, the US-letter format letterpaper can be used alternatively.

\documentclass a4paper letterpaper

Tip: You can add the option draft as argument of \documentclass to highlight overfull hboxes. This will also temporarily replace figures with placeholders, which might speed up the compilation process.

draft

Options: Table 1 shows the most common options for arguments of \documentclass. Some of the options are explained in later sections: USenglish (Section 2.2.2), UKenglish (Section 2.2.2), numberwithinsect (Section 2.7), cleveref (Section 2.10), autoref (Section 2.10), anonymous (Section 2.3), and authorcolumns (Section 2.3).

Table 1 Common Options for \documentclass.

Option	Description
a4paper	A4 paper format
letterpaper	US-letter format
draft	Highlight overfull hboxes
USenglish	Enables US-English specific typographical rules
UKenglish	Enables UK-English specific typographical rules
numberwithinsect	Enables section-numbered lemma etc.
cleveref	Enables support for the cleveref package
autoref	Enables support using autoref provided by the hyperref package
anonymous	Enables support for double-blind peer-review
thm-restate	Enables support for the thm-restate package for restating theorems
authorcolumns	Enables two-column displaying of author details (only applicable for
	more than 6 authors)
pdfa	Enables the generation of a PDF according the PDF/A standard

2.2.2 Language

The document language is chosen in the optional argument of the \documentclass command in the LATEX master file. This is necessary to influence the "culturally-determined typo- UKenglish" UKenglish

⁸ See https://www.pdfa.org/

graphical (and other) rules" (like hyphenation) within the document. Possible values are USenglish, UKenglish and others⁹.

Tip: Older version of the used LATEX package babel might not know the default language (UKenglish). For many installations, setting english as the document language solves the problem: \documentclass[english] {oasics-v2021}. Please note that out-dated language options such as english will be replaced by the OASIcs default UKenglish during the finalization process.

2.2.3 Input Encoding

oasics-v2021 preselects UTF-8 as input encoding. Please do not change the input encoding because otherwise the volume compilation might become difficult.

2.2.4 Fonts

oasics-v2021 uses the Latin Modern font family. This is a recent redesign of the good old Computer Modern fonts. Latin Modern provides many characters and all necessary mathematical fonts. If your TEX installation does not provide the Latin Modern family, Computer Modern is used as a fallback. Do not use a different main font. For example, the usage of the times package is forbidden.

oasics-v2021 preloads the package amssymb to make additional mathematical symbols available. Other symbol packages, e.g., stmaryrd, may be added. Moreover, the script mathematical alphabet is provided by loading the eucal package. Please avoid loading the MnSymbol package. (Note that oasics-v2021 removes all symbol re-definitions done by MnSymbol anyhow, but would retain its newly introduced symbol definitions.)

To ensure the PDF/A compliance, please make sure that all fonts are embedded in all used PDF files (e.g. figures).

2.2.5 **Colors**

In the OASIcs style, very few colours are used for purely aesthetic purposes. To increase readability especially for color-blind persons, we recommend not to use colors for emphasizing text. Instead of this other mechanisms like \textbf, \emph or dashed boxes (e.g. provided by dashbox¹⁰ package) can be used.

Table 2 lists all colors that are pre-defined and used in oasics-v2021. To reuse one of the prefined colors, just use the name given in the first column of the table (e.g. \textcolor{oasicsGray}).

To ensure the PDF/A compliance, please only use colors from the sRGB color space. The usage of colors from the CMYK color space is not supported as PDF/A doesn't allow the mix of color spaces.

2.2.6 Spacing and Page Length

oasics-v2021 provides a liberal spacing to improve the readability of the articles. Please do not modify the default spacing and also do not use any packages (e.g. savetree) to manipulate the OASIcs default spacing. It will be reset to default during the final typesetting

\dashbox

⁹ This depends on the IATEX package babel. For further details, please visit the documentation of the package at https://www.ctan.org/pkg/babel.

¹⁰ https://ctan.org/pkg/dashbox

Table 2	Pre-defined	colors in	oasics-v2021.

Name	Color	rgb Code	Usage
oasicsGray		0.31, 0.31, 0.33	heading in top matter, enumerations
oasicsBulletGray		0.60, 0.60, 0.61	bullet points, footnoterule
oasicsLineGray		0.51, 0.50, 0.52	line in heading of abstract and bibliography
oasicsLightGray		0.85,0.85,0.86	background of listings
oasicsYellow		0.99, 0.78, 0.07	section numbers, figure and table captions

process by the OASIcs office. To avoid any problems due to the OASIcs liberal spacing, it is highly recommended for the editors of OASIcs volumes to set a flexible page limit ¹¹ (e.g., of 12–15 pages) and to explicitly exclude the bibliography, the first page(s) containing the top matter (authors, affiliation, keywords, abstract, ...) and a brief appendix (of up to 5 pages) from this page limit.

During the preparation, the authors should take care of suitable linebreaks and pagebreaks. For instance, no overfull \hboxes should occur in the warnings log.

\hbox

2.2.7 Main Elements in the Document

The body of a OASIcs document consists in general of the following elements:

- top matter containing the metadata describing the document (see Section 2.3);
- section headings (see Section 2.4);
- figures and tables (see Section 2.5);
- lists (see Section 2.6);
- theorem-like environments like lemmas, definitions, remarks, and proofs (see Section 2.7);
- mathematics, both in text and in display style (see Section 2.8);
- listings and algorithms (see Section 2.9);
- references (see Section 2.10);
- and text.

2.3 Top Matter: Authors, Affiliations, and other Metadata

The term "top matter" is used in this document for the metadata information found at the beginning of an article. It includes information that would appear in a bibliographic reference to the paper, plus information to clearly identify the authors, funding information, acknowledgements, and the abstract. The top matter also includes information such as subject classification and keywords that simplifies the indexation of the articles. Some elements are required, while others are optional (each element is described in detail below).

The header of a OASIcs article is the only part where some specific commands/environments are required:

The title is tagged as usual with the \title{...} command. If you need a short form for the running head, use the optional \titlerunning{...}. The title (as well as headings in the document) should be capitalized (see Section 2.4 for further details).

\title \titlerunning

¹¹ Please note that we expect a certain flexibility at any page limit (+/- 1 page) to avoid too much extra effort to harmonize OASIcs-compliant formatting and page limit for both authors and final typesetting

1:8 OASIcs: Instructions for Authors and the oasics-v2021 Class

\author

\and

- Authors and their affiliations are rendered blockwise for OASIcs¹². The information for each author has to be tagged with a redefined \author macro, which is structured as follows: \author{name}{affil}{email}{orcid}{funding}. While the parameters name and affil are mandatory, the parameters email, orcid, and funding are optional and can be empty.
- For each author at least one affiliation has to be provided. It is up to the author to decide about the level of detail of the affiliation information, but at least the main affiliation name, the city¹³, and country have to be provided. Further details like department or postal address are optional. If several affiliations should be provided for one author, please use the \and macro to separate the different affiliations. Authors without an affiliation should at least indicate their place of residence and their country of residence. An (optional) URL of an author's personal webpage should simply be added to the affiliation with \and, for instance

\author{John Q. Public}

{Dummy University Computing Laboratory, [optional: Address], Country \and My second affiliation, Country \and \url{http://www.myhomepage.edu}}

{johnqpublic@dummyuni.org}

{https://orcid.org/0000-0002-1825-0097}

{[optional] author-specific funding acknowledgements}

- The usage of an ORCID is currently optional but highly recommended. For more details regarding ORCID, please visit https://orcid.org/. If you don't have an ORCID yet, the registration is very quick and simple (see https://orcid.org/register). Please enter the full https URL including hyphens between every fourth digit as recommended by ORCID¹⁴. In the PDF, the ORCID symbol that links to the ORCID profile is shown behind the respective author. With the next upgrade of Dagstuhl Research Online Publication Server (DROPS), ORCIDs will also become part of the machine readable metadata set.
- Per default, author details (name, affiliation, ...) are displayed in one column under each other. In case of many authors, this might result in a lot of whitespace (especially if the authors have only short affiliations). To avoid this, it is possible to activate a two column style for the authors by adding authorcolumns as argument of the \documentclass: \documentclass[authorcolumns] {oasics-v2021}. Please note that this option is only available in case of more than 6 authors.

There is a mandatory **\authorrunning{...}** macro for the running header concatenating all author names (first names have to be abbreviated).

- \Copyright{...} has just one argument specifying the copyright holder that is usually the team of authors. Please concatenate the full names of all authors¹⁵.
- To hide all author related information e.g. for double-blind peer review, please add anonymous as argument of the \documentclass: \documentclass[anonymous]{oasics-v2021}.

authorcolumns

\authorrunning \Copyright

anonymous

by the OASIcs Office.

¹² This has changed in 2017; the formerly used authblk mechanism to output authors and affiliations in footnote style is deprecated; the \affil command is obsolete for the oasics-v2021 class.

 $^{^{13}}$ The city is only mandatory if it is not part of the affiliation name.

¹⁴ https://support.orcid.org/knowledgebase/articles/116780

¹⁵ Please add "serial comma" also know as "Oxford comma" before "and".

\ccsdesc{...} is for classification information following the ACM 2012 Computing Classification System; it is required, too. Please use one \ccsdesc command per classification. If the command is used several times, all specified classifications are concatenated in the resulting PDF (using semicolons as auto-generated delimiters). The \subjclass command used in previous versions OASIcs IATEX style is obsolete. Please choose 1-3 ACM 2012 classifications from https://submission.dagstuhl.de/services/acm-subject-classification.

\ccsdesc

■ \keywords{...} must be used to capture keywords. Please use commas as delimiters. The first word of the list and every proper noun should be capitalized. All other items should be lowercase.

\keywords

■ \category{...} may be used to provide category information. This macro should only be used for "special" papers (like "invited papers") and not for regular articles. Please consult the responsible editor of the volume.

\category

\relatedversiondetails{...} may be used to denote a related version like a "Full Version", "Extended Version", or also a predecessor usually published in a repository like arXiv or HAL. The macro has two mandatory parameters and two optional arguments: \relatedversiondetails[linktext={...}, cite=...]{Classification}{URL} to be used as follows:

\relatedversiondetails

- Classification: Classification of the related version, e.g. "Extended Version", "Full Version", or any free text;
- URL: Persistent URL of the related version 16;
- linktext: This text is shown alternatively to the actual URL. Please use only to manually add linebreaks to the URL.
- **cite**: BibT_EX key of the related version.

The macro \relatedversion{...} may be used to provide an additional textual explanation, which might especially be useful in case of several related documents. Figure 1 shows an example for such a use case. The according LATEX code is depicted in Listing 1.

\related-

```
Related Version This paper is based on our following two technical reports:

Previous Version: https://arxiv.org/abs/XYZ.ZYX1 [2]

Previous Version: https://arxiv.org/abs/XYZ.ZYX2 [1]
```

- Figure 1 Example for \relatedversiondetails and \relatedversion usage.
- **Listing 1** LaTeX code of Figure 1.

¹⁶ Please note: As hosting on a (personal or university) webpage or in cloud storage is not really sufficient for durable / persistent file storage, we highly recommend you to publish your document in a reliable repository like arXiv or HAL. This recommendation also applies to supplementary materials such as data, software, posters, . . . , slides. Please store them in repositories such as zenodo or Software Heritage.

1:10 OASIcs: Instructions for Authors and the oasics-v2021 Class

\supplement-details

- \supplementdetails{...} may be used to denote supplementary material like related research data, source code, ...slides hosted on a repository¹⁶ like zenodo¹⁷, figshare¹⁸, ..., Software Heritage¹⁹. The macro has two mandatory parameters and four optional arguments: \supplementdetails[linktext={...}, cite=..., subcategory={...}, swhid=...]{Classification}{URL} to be used as follows:
 - Classification: Classification of the supplementary material using a controlled vocabulary. Allowed values are Audiovisual, Collection, DataPaper, Dataset, Event, Image, InteractiveResource, Model, PhysicalObject, Service, Software, Sound, Text, Workflow, and Other²⁰.
 - URL: Persistent URL of the supplementary material ¹⁶;
 - linktext: This text is shown alternatively to the actual URL. Please use only to manually add linebreaks to the URL.
 - cite: BibTFX key of the supplementary material.
 - **subcategory**: Free text subcategory to further specify the supplementary material
 - swhid: Software Heritage Identifier²¹ of the archived supplementary material. This is especially recommended for software²².

\supplement

\supplement{...} may be used to provide an additional textual explanation, which might especially be useful in case of several supplementary materials. Figure 2 shows an example for such a use case. The according LATEX code is depicted in Listing 2.

Supplementary Material ECRTS 2019 Artifact Evaluation approved artifact and the source code for the Dagstuhl Publishing styles used to prepare this document can be found as follows:

Software (ECRTS Artifact Evaluation approved artifact): https://doi.org/10.4230/DARTS.5.1.0

Software (Source Code): https://github.com/dagstuhl-publishing/styles/
archived at swh:1:dir:1b66fc29b44e371e68a77879c0fbebefe3cd34f8

- Figure 2 Example for \supplementdetails and \supplement usage.
- Listing 2 L⁴T_FX code of Figure 2.

\funding

■ \funding{...} may be used to capture a general funding statement. Note that we recommend to provide those kind of funding acknowledgements that can be clearly assigned to a specific author in the corresponding \author macro. In the PDF document, all the funding information is displayed in a coherent block, where the author-specific details will automatically be preceded by the name of the author.

 $^{^{17} \}mathtt{https://zenodo.org/}$

¹⁸ https://figshare.com/

¹⁹ https://www.softwareheritage.org/

²⁰ For detailed description of these types, please see the appendix of the DataCite Metadata Schema https://doi.org/10.14454/7xq3-zf69

 $^{^{21}\}mathrm{See}\ \mathrm{https://docs.softwareheritage.org/devel/swh-model/persistent-identifiers.html}.$

 $^{^{22}}$ The Dagstuhl Submission System will also provide extended support for this in the near future.

To display a flag or logo near the funding information as requested by some funding agencies (e.g. ERC grant), please use the \flag command within the funding statement, e.g. \flag{ERCandEU.pdf}²³.

■ \acknowledgements{...} may be used to capture an acknowledgement.

\acknowledgements

abstract

The commands mentioned so far should be used in the document preamble of the LATEX file. Providing a title, at least one author (incl. \authorrunning), copyright information, subject classification, and keywords is required.

To typeset an abstract use $\begin{abstract}...\end{abstract}$. The environment must be placed after $\begin{document} and \mbox{maketitle!}$

Note that subject classifications, keywords, ..., and acknowledgements will be rendered together with the abstract. So it is necessary to use the abstract environment in order to get the output for keywords, ccsdesc etc.

All the copyright information (and a possible DOI specification) on the first page can be hidden using the \hideOASIcs command. This might be useful to prepare a document using the OASIcs style, but which is not intended to be published within the series (e.g. for an extended version to be published on arXiv).

\hideOASIcs

2.4 Structuring the Document

To organize the content and to structure the document, the default IATEX commands for headings have to be used. At least the first three levels of section headings have to be numbered to support the internal referencing of the respective sections and also to simplify referencing in other documents. Table 3 provides an overview of the provided heading commands. All headings, including the title, have to be left aligned and should be capitalized.

\subsection
\subsection
\subsubsection
\paragraph
\paragraph*
\subparagraph

Please do not revise the provided commands and e.g., modify text size or spacings. Moreover, please do not add self-defined commands to structure your document. The OASIcs office will reset self-defined heading styles to the default, for instance \medskip\noindent\textbf{Some subparagraph.} will be replaced by \subparagraph*{Some subparagraph.}

Table 3 Headings.

Command	Level	Example	Font size and style
\title	0	This is the Title	17.28pt, bold
	1	1 Section	12pt, bold
	2	1.1 Subsection	12pt, bold
$\sl_subsubsection{}$	3	1.1.1 Subsubsection	12pt, bold
	4	1.1.1.1 Paragraph	10.5pt, bold
\paragraph*{}	4	Paragraph	10.5pt, bold
\subparagraph*{}	5	Subparagraph. Some text after	10pt, bold

²³ Logos and flags are not part of the style package and have to be added manually. ERC logos can be found here: https://erc.europa.eu/managing-your-project/communicating-your-research

Capitalization. The title of the document has to be capitalized: The first word (and usually the last word) is capitalized, as well as all major words. Minor words are in lower case. For a detailed description, please use the Chicago Style Guideline or use a web service, such as http://individed.com/code/to-title-case/. This way of capitalization is also recommended for headings.

\label
\ref
\cref
\autoref

Referencing. LATEX provides an easy mechanism to reference sections and also almost everything else that is numbered (e.g., figures, tables, algorithms, ...). To use this mechanism, all referenced items should have a marker (a.k.a. \label{key}) and instead of direct textual references, the command \ref{key} should be used within the LATEX code.

It is up to the authors to use the extended functionalities provided by either the cleveref²⁴ package or the \autoref{} command, which is part of the hyperref²⁵ package. To use these functionalities, please add cleveref and/or autoref as argument of the \documentclass:\documentclass[cleveref, autoref]{oasics-v2021}. This is explicitly necessary for using these mechanisms with theorem-like environments. Otherwise all theorems, lemmas, corollaries, ... will be referenced as theorems (see also Section 2.7).

2.5 Figures and Tables

figure table

Figures, tables, and all other floating objects (like algorithms) can be placed at the top or bottom of a document page (using the placement option t or b, e.g., \begin{figure}[t]). Alternatively they can be placed on a separate page using the placement option p. The top position is the preferred position. The fixed position in the document (placement option h) should only be used rarely as small changes in the document might result in a completely different layout.

wrapfig

Wrapping of text around figures and tables is not supported. So don't use packages like wrapfig.

\caption \label \ref Use captions, labels, and references for all floating objects explicitly (e.g., "as depicted in Figure \ref{fig:example}") and not implicitly (e.g., "as depicted in the figure below"). Figure captions have to be placed below the figures. Table captions (and also captions of other text-like floating environments like listings and algorithms) have to be placed above the table. Captions are always left aligned.

\subcaption subfigure subtable For small/related figures place figures as sub-figures within one figure. At least the main figure should have a textual caption. The preloaded subcaption²⁶ package provides the \subcaption command to add sub-captions. Alternatively it provides subfigure and subtable environments. Please do not load the deprecated subfig package. The following fragment shows the code resulting in Figure 3:

oasics-logo-bw.pdf

(a) Subfig 1.

(b) Subfig 2.

Figure 3 Just an Example.

²⁴ https://ctan.org/pkg/cleveref

²⁵ https://ctan.org/pkg/hyperref

²⁶ https://ctan.org/pkg/subcaption

Listing 3 L⁴T_FX code of Figure 3.

```
\begin{figure}
  \begin{subfigure}[t]{0.5\textwidth}
    \centering
    \includegraphics[draft, width=0.3\textwidth]{oasics-logo-bw}
    \caption{Subfig 1.}
  \end{subfigure}\hfill
  \begin{subfigure}[t]{0.5\textwidth}
    \centering
    \includegraphics[draft, width=0.3\textwidth]{oasics-logo-bw}
    \caption{Subfig 2.}
  \end{subfigure}
  \caption{Just an Example.}\label{fig:example}
\end{figure}
```

Figures and tables have to be centered. For figures and tables placed within a floating environment, use \centering. For figures and tables placed directly within the text, use the center environment.

It is highly recommended to use vector graphics whenever possible. Alternatively, authors should provide figures with a high resolution (300 dpi or more).

To ensure PDF/A compliance of the resulting document, also embedded PDF files such as figures have to be completely self-contained. For this reason the fonts in all used PDF files (e.g. figures) have to be embedded in them. Furthermore, PDF/A doesn't allow mixing color spaces. The default color space in oasics-v2021 is the sRGB color space. So please don't use other color spaces.

Hint. If your figure consists mainly of text, we highly recommend to frame the figure (e.g. using the command \fbox). This significantly helps to separate the content of the figure from the adjacent main text. Figure 4 shows an example for such a framed figure. The according LATEX code is depicted in Listing 4.

Lorem ipsum dolor sit amet, consetetur sadipscing elitr, sed diam nonumy eirmod tempor invidunt ut labore et dolore magna aliquyam erat, sed diam voluptua. At vero eos et accusam et justo duo dolores et ea rebum. Stet clita kasd gubergren, no sea takimata sanctus est

Figure 4 Example for framed figure with mainly textual content.

Lorem ipsum dolor sit amet.

Listing 4 LATEX code of Figure 4.

```
\begin{figure}
\centering
\fbox{
\begin{minipage}{0.9\textwidth}
Lorem ipsum dolor sit amet ...
\end{minipage}
\caption{Example for framed ...}
\label{fig:framedExample}
\end{figure}
```

2.5.1 **Graphics**

The standard interface for graphic inclusion is the \includegraphics command provided by the graphicx package. Note that the \graphicspath command allows authors to declare one or more folders in which the graphicx package looks for the image files; so providing the path with each \includegraphics command is not necessary.

\include-

\centering

center

graphics \graphicspath

2.5.2 **Tables**

Preloaded packages are: the array²⁷ package (for introducing new column types), the multirow²⁸ package (row spanning cells) and the tabularx²⁹ package (automatic column width calculation).

The threeparttable package is preloaded to ease the use of table footnotes. Please read the short documentation in threeparttables.sty30 to see how the related commands are applied.

2.5.3 **Rotating Floats**

sidewaysfigure sidewaystable

The preloaded rotating package provides the two environments sidewaysfigure and sidewaystable. They allow for the rotation of floating objects.

2.6 Lists, Enumerations, and Descriptions

itemize enumerate description Other elements that provide structured information within IATEX documents are bulleted lists (also known as itemize environments), enumerations (a.k.a. enumerate environments), and descriptions. List labels are set flush left.

The enumerate³¹ package is preloaded, so you can use \begin{enumerate}[(a)] or the like. oasics-v2021 provides several predefined environments, namely itemize, enumerate, alphaenumerate, romanenumerate, bracketenumerate, and description. Examples of the different styles are depicted in Section B in the appendix.

Please do not use other packages like enumitem or paralist to revise itemize or enumerate environments, as they change the predefined layout of all related environments and therefore will be removed by Dagstuhl Publishing in the final typesetting process.

enumitem paralist

2.7 Theorem-like Environments

To display theorem-like fragments appropriately, the amsthm³² package is preloaded, and the following environments are already introduced: theorem, lemma, conjecture, corollary, definition, proposition, exercise, example, note, note*, observation, remark*, remark, claim, and claim*. For the predefined environments, a consecutive numbering is applied, e.g., all predefined theorem-like environments use the same counter. Examples of the different styles are depicted in Section C in the appendix.

Setting up additional environments works with the \newtheorem mechanism from the amsthm package. For example, add to your document preamble

\newtheorem{conjecture}[theorem]{Conjecture}

See also the amsthm package documentation.

Available \theoremstyles are: plain, definition, remark, and claimstyle (the first three are from the amsthm package, but slightly modified for OASIcs).

Note that for OASIcs it is recommended that all numbered theorem-like environments use one and the same counter, i.e., the counter of the default environment theorem.

theorem

lemma

conjecture corollary definition proposition exercise example note note* observation remark* remark

claim

claim*

 $^{^{27}\,\}mathrm{https://www.ctan.org/pkg/array}$

²⁸ https://www.ctan.org/pkg/multirow

²⁹ https://www.ctan.org/pkg/tabularx

 $^{^{30}\,\}mathrm{https://www.ctan.org/pkg/threeparttable}$

³¹ https://www.ctan.org/pkg/enumerate

³² https://www.ctan.org/pkg/amsthm

By default, theorem-like environments are numbered consecutively throughout the document. To number the environments subordinately within sections use the class option numberwithinsect: \documentclass[numberwithinsect] {oasics-v2021}.

Additional to the above mentioned numbered environments, oasics-v2021 also provides two unnumbered proof environments: proof and claimproof. Both differ only in the delimiting QED symbol; ◀ is automatically appended at the end of proof environments; ⊲ is appended at the end of claimproof environments. To add the QED symbol manually at a certain position (e.g. to avoid the QED symbol in a new, empty line after an enumeration) use \quad \quad \quad \text{qedhere} in a proof environment or \claimqedhere in a claimproof environment.

numberwithinsect
proof
claimproof

\qedhere \claimqedhere

Hint 1. To improve the readability of long proofs, it may be necessary to structure these proofs additionally. For this purpose it is strongly recommended to use description environment. Alternatively, the style provides a \proofsubparagraph command to add a subparagraph-like heading within the proof.

\proofsubparagraph

To repeat a theorem-like environment, the style supports the package thm-restate, thm-restate which is provided as part of the thmtools³³ bundle. To activate this support, please add thm-restate as argument of the \documentclass:

\documentclass[thm-restate]{oasics-v2021}.

For further information, please see the thmtools documentation.

Hint 2. In difference to the style provided by amsthm package, the body of the definition environment is formatted as in theorem environments, e.g. italic text and not upright text as in the original environment. This should help to separate text of the definition from surrounding regular text. If an upright text as in the original environment is preferred, please add an alternative definition environment to the document preamble, e.g. as follows:

\theoremstyle{definition}
\newtheorem{definition2}[theorem]{Definition}

Hint 3. Depending on the style of the environment, it might be difficult to clearly identify the end of the respective environment, see the following example:

This is just some regular text right before an example environment.

▶ **Example 1.** This is the first paragraph of the example. Lorem ipsum dolor sit amet, consetetur sadipscing elitr, sed diam nonumy eirmod tempor invidunt ut labore et dolore magna aliquyam erat, sed diam voluptua.

This is another paragraph of the example. Lorem ipsum dolor sit amet, consetetur sadipscing elitr, sed diam nonumy eirmod tempor invidunt ut labore et dolore magna aliquyam erat, sed diam voluptua.

This is regular text after the example. Lorem ipsum dolor sit amet, consetetur sadipscing elitr, sed diam nonumy eirmod tempor invidunt ut labore et dolore magna aliquyam erat, sed diam voluptua.

³³ https://www.ctan.org/pkg/thmtools

\oasicsEnd

In this case, some authors prefer to clearly mark the end of the environment. This can be done using the command \oasicsEnd. This will add a symbol (\$\lrcorner\$) at the end of the line (similar to a ged symbol), see Example 2 below:

▶ **Example 2.** This is the first paragraph of the example. Lorem ipsum dolor sit amet, consetetur sadipscing elitr, sed diam nonumy eirmod tempor invidunt ut labore et dolore magna aliquyam erat, sed diam voluptua.

This is another paragraph of the example. Lorem ipsum dolor sit amet, consetetur sadipscing elitr, sed diam nonumy eirmod tempor invidunt ut labore et dolore magna aliquyam erat, sed diam voluptua.

Hint 3. As mentioned previously, to use cleveref and/or autoref also with theorem-like environments, please add cleveref and/or autoref as argument of the \documentclass:\documentclass[cleveref, autoref]{oasics-v2021}.

2.8 Equations / Mathematical formulas

Equations or mathematical formulas can either be in line with the text (using \dots) or in an equation-type environment (e.g., \dots). The latter use is also known as display math mode. In this display math mode, the separately displayed formulas should be numbered (consecutive numbering is recommended). Important equations (and all large equations) should be placed in a separate block (i.e. in display math mode) and not inline. Furthermore, important equations should be labeled to reference them.

The amsmath package is preloaded, and you are encouraged to use the mark-up it provides instead of old-style standards like the eqnarray environment or the \over command.

\$\$...\$\$

\$...\$

equation*

\[...\]

\[...\]

align, align*

Display math formulas. Do not use the T_EX primitive \$\$...\$\$ to typeset display math formulas as this might cause problems³⁴, for instance the alignment option is ignored. Instead use the I^AT_EX variant of this environment, namely [...]. During the final typesetting process, the OASIcs office will replace \$\$...\$\$ with [...].

To avoid inconsistent spacing, do not use the displaymath, eqnarray, or eqnarray* environments because those are not supported by the preloaded amsmath package. \[...\] may be used instead of displaymath, while eqnarray, and eqnarray* may be replaced with align, or align*.

Display math formulas are aligned left. So do not use environments that ignore/change this alignment of these formulas. Deviating from this rule, the centered setting of inference rules (e.g. using the mathpartir³⁵ package) is permitted, however, for reasons of consistency, a left-justified orientation is also recommended here.

2.9 Listings and Algorithms

An important part in many computer science publications is "pseudo code" or code fragments. In the LATEX ecosystem, several packages exist to format code/algorithms. It is highly recommended to use one of the following packages and not to use self-defined environments: listings³⁶, algorithm³⁷, or algorithm²⁸.

³⁴ For more details, visit https://ctan.org/pkg/12tabu-english, [1].

³⁵ https://www.ctan.org/pkg/mathpartir

³⁶ https://www.ctan.org/pkg/listings

³⁷ https://www.ctan.org/pkg/algorithms

³⁸ https://www.ctan.org/pkg/algorithm2e

The listings package is preloaded. It provides the lstlisting environment to typeset displayed code. Here, the package is configured to produce a grey background for listings.

The following example shows how to use captions and labels with the lstlisting environment:

The resulting code is depicted in Listing 5.

Listing 5 Useless code.

```
for i:=maxint to 0 do
begin
    j:=square(root(i));
end;
```

Also note the float option that makes the listing float. Instead of the caption option, one might prefer the title option, which outputs the argument without the "Listing" label. To globally change the label name from "Listing", add to your document preamble e.g.,

\renewcommand{\lstlistingname}{Algorithm}

Please read the package documentation for more information on the lstlisting environment and how to adapt it locally.

The other above-mentioned recommended packages to include code or algorithms, algorithm and algorithm2e are not preloaded. It is up to the authors to load one of these packages. If so, please use the option ruled to ensure the correct placement of the caption (as mentioned before, captions of text-like content are placed above the content and left aligned), for instance \usepackage[ruled]{algorithm} or \usepackage[ruled]{algorithm2e}. For further details, please read the documentation of these packages.

algorithm
algorithm2e

2.10 Bibliography and References

OASIcs uses BIBT_EX to format references. Thereby the BIBT_EX style plainurl is used for BIBT_EX processing. Please do not change the bibliographic style. OASIcs only allows for numerical citation and forbids author-year citations. (So the natbib package is not used by oasics-v2021.)

macro. \cite
to the nocite(*)

All entries of the bibliography has to be referenced in the text by using the cite macro. So do not use the command \nocite{*} to add unreferenced bibliographic entries to the bibliography.

In general, references should be as complete as possible. So the authors should not abbreviate author names or journal names in references and should ensure that all mandatory fields according to the BibTeX standard are available, e.g., no errors and warnings about the referenced BibTeX entries should occur. If possible references should contain an external link (e.g., DOI or URL). DOI is preferred.

\bibliography \bibliographystyle {plainurl}

1:18 OASIcs: Instructions for Authors and the oasics-v2021 Class

Hint. The *dblp computer science bibliography*³⁹ indexes more than 4 million publications from major computer science outlets. A large amount of the indexed publications also come with a DOI. Furthermore, *dblp* provides a BibTEX export service, so that exported entries can be easily reused in the paper's bibliography. It is highly recommended to use *dblp* to enrich the references and add missing DOIs, for example.

2.11 Line numbers

\nolinenumbers

The lineno package is loaded, and line numbering is switched on by default. To (globally) switch line numbering off, use \nolinenumbers (in the document preamble).

2.12 Packaging and Submission

Please provide a self-contained archive file containing all files necessary to compile/process the document. It is mandatory that there is exactly one LATEX file per article (and no include-files for sections/subsection) and one BIBTEX file. All other files like graphics should be part of the archive.

³⁹ https://dblp.org; Search: https://dblp.org/search/

3 Publication Workflow and Final Typesetting

After the submission of the camera-ready version of the document to the Dagstuhl Publishing submission server, the document will be checked/revised by the editors and finally by Dagstuhl Publishing.

3.1 Submission Workflow

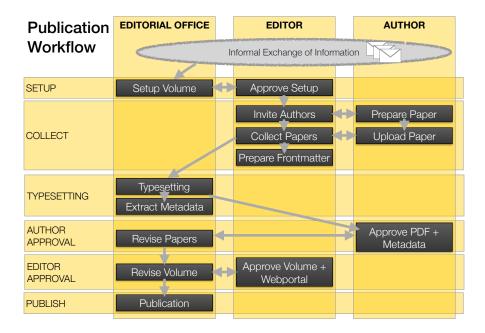

Figure 5 Publication Workflow.

Figure 5 gives an overview of the various steps on the way to publishing a volume/article that take place after the review process. Usually 6–12 months before the planned publication of the volume the OASIcs office clarifies some necessary details (e.g. the aimed date of publication and a raw and preliminary schedule). This **informal exchange of information** usually happens by E-mail. The actual **publication workflow** of the volume starts approx. 12–16 weeks before the planned publication (e.g. the conference) and contains the following sub-steps, which all take place in the Dagstuhl Submission System https://submission.dagstuhl.de.

- 1. During the **setup** phase, the OASIcs office and the editors determine the key data of a new volume: schedule, editor details, paper categories (such as "Invited Talk", "Short Paper", "Regular Paper") and the author agreement. This step ends up with a web-portal for the volume on the Dagstuhl submission server (being set-up by Dagstuhl Publishing) which guides editors and authors through all further steps.
- 2. Using this web-prtal the editors then **collect** the camera-ready versions of the articles to be published. They inform the authors about the acceptance of their article and invite them to submit their camera-ready version directly to the submission system.
 - a. The authors **prepare** their article according to the instructions provided in this document and upload a zip-archive containing all source files as described in Section 2.12 along with a signed author agreement.

- During the submission, the LaTeX document is compiled on the server.
- Only correct and complete documents are accepted.
- After the submission of the LaTeX document, the author is asked for missing (mandatory) metadata.
- **b.** The editors monitor the submission process and take care that all authors submit complete source files in due time. It is not expected that the editors compile/revise/typeset the provided sources.
- c. After the submission, the editors check the final order of the submitted articles within the submission tool and prepare a draft of the **frontmatter**⁴⁰.
- 3. After the volume has been submitted to Dagstuhl Publishing by the editors, the OASIcs office carefully checks all papers and revises them to achieve compliance with the instructions provided in this document. These checks include the actual **typesetting** of the documents as well as the respective **metadata**. All changes (and open issues, if any) are documented in a changelog provided to the authors in the next step.
- 4. Usually two to three weeks before publication of the volume, the OASIcs office asks the authors for their approval of the revised documents and the metadata. To avoid any delay of the publication process, this author approval phase is limited to 3–5 days. In order to enable all authors to participate, the exact period will be announced to the authors at least one week in advance. Authors may then also authorize other users to perform the approval for them, if necessary. If the authors (or authorized users) nevertheless allow the approval period to expire, the corresponding article is considered passively approved.
- 5. After a possible revision of the documents and/or their metadata incorporating the feedback of the authors, the OASIcs office asks the **editors for approval** of all documents and the complete volume.
- **6.** After the editor approval, the OASIcs office officially **publishes** the proceedings volume (including DOI registration, registration for long-term archiving, submission to indexing services like dblp or Google Scholar).

All above mentioned sub-steps of the submission process are actively supported by the Dagstuhl Submission System introduced in Spring 2019.

3.2 Final Typesetting

The final typesetting of the document is done by the OASIcs office before asking for the author's approval for publication. In this phase, the OASIcs office tries to adapt/revise the documents as little as possible, while still achieving a consistent appearance in line with the corporate identity of the OASIcs series. Basically, the articles are revised to ensure compliance with the standards described in this document. Nevertheless, the publisher tries to maintain the personal touch of the authors. If the instructions given in this document and the template file (oasics-v2021-sample-article.tex provided with the style archive) have been followed closely, only minimal changes will be made to the articles if any.

The internal workflow during the typesetting process is essentially based on the list of requirements given in Section 1. In particular,

- the \documentclass and paper-format of the article will be checked;
- individual (non-style-compliant) spacing and font modifications will be removed;

⁴⁰ The editors only have to prepare the editor details, the preface, and details regarding the conference organisation. Volume-specific information and the final table of contents will be added by the OASIcs office during the finalisation of the volume.

- the top matter and mandatory metadata fields will be checked/corrected;
- default sectioning commands will be applied wherever possible and \texorpdfstring{...}{...} macros will be inserted for non-ascii headlines;
- default enumeration/itemization/description styles will be applied wherever possible (see Section 2.6 and Appendix B);
- default theorem-like environments and the corresponding proof environments will be used wherever possible (see Sections 2.7 and Appendix C);
- default math environments will be applied wherever possible (see Section 2.8);
- figures, tables and listings/algorithms will be revised to fit the standards described in Section 2;
- in particular, wrapped figures will be converted into ordinary figure-environments;
- all overfull \hboxes will be removed;
- quotation marks will be standardized to "...", dashes will be standardized to "-";
- in exceptional cases font-sizes and scaling are revised to improve the readability;
- the BibTeX file is revised by adding missing mandatory fields (according to the BibTeX standard) and enabling or adding URL/DOIs where applicable.
